Customer satisfaction is just one of the factors contributing to the success (or failure) of a business — and if set aside, it may cost you too much. It is essential for creating a strong relationship with your customers and maintaining their loyalty, that's why it should be taken very seriously.

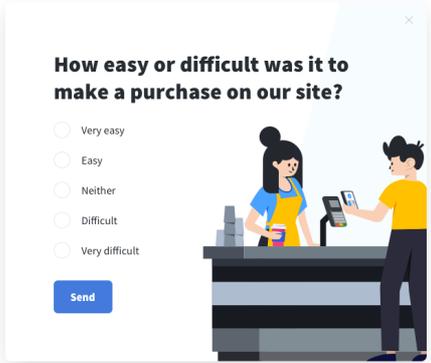

One of the best ways to find out what your customers think of your product and show them that you care for their opinion is running a **customer satisfaction survey**. And the key to a successful survey is asking the right questions: thus you can not only learn how they feel in general but also shed some light on the areas of your business that require improvements.

In this post, we'll discuss some popular customer satisfaction survey templates and the best practices you can use to design such a survey for your site.

What template to choose?

There are several most commonly used customer satisfaction survey templates that have been tested through the years and show good results. As a rule, they are based on a response scale methodology and include just one question. Surprisingly, it turns out to be quite enough to get a sneak peek into customers' attitude towards your product or service.

Customer Effort Score (CES)

The image shows a screenshot of a survey form titled "How easy or difficult was it to make a purchase on our site?". The form includes a list of five radio button options: "Very easy", "Easy", "Neither", "Difficult", and "Very difficult". A blue "Send" button is located below the options. To the right of the text is an illustration of a woman at a counter interacting with a man who is holding a smartphone. The entire form is displayed within a white box with a close button in the top right corner, set against a light gray background.

How easy or difficult was it to make a purchase on our site?

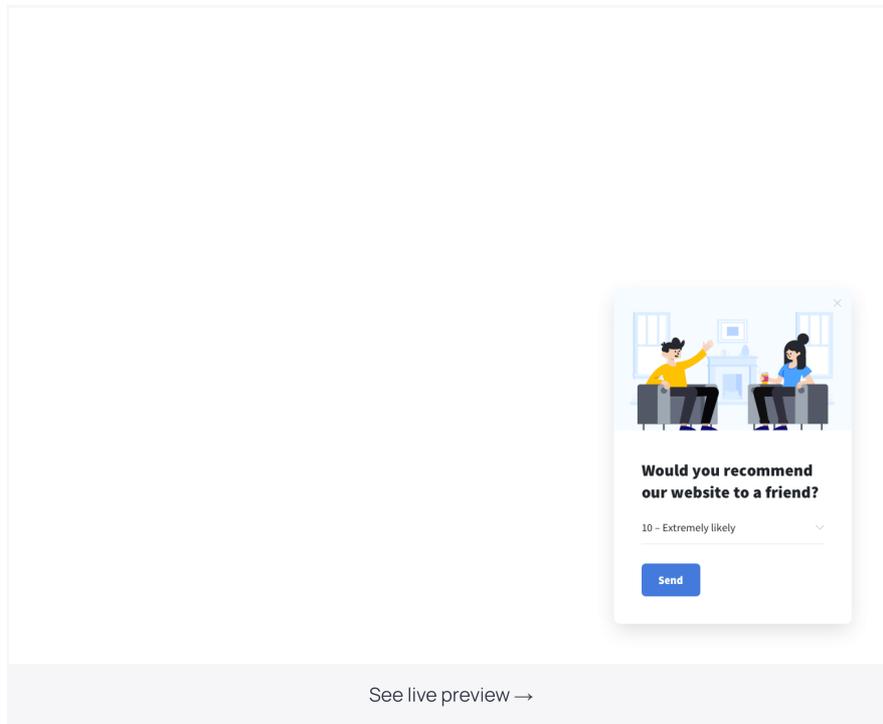

- Very easy
- Easy
- Neither
- Difficult
- Very difficult

[Send](#)

[See live preview →](#)

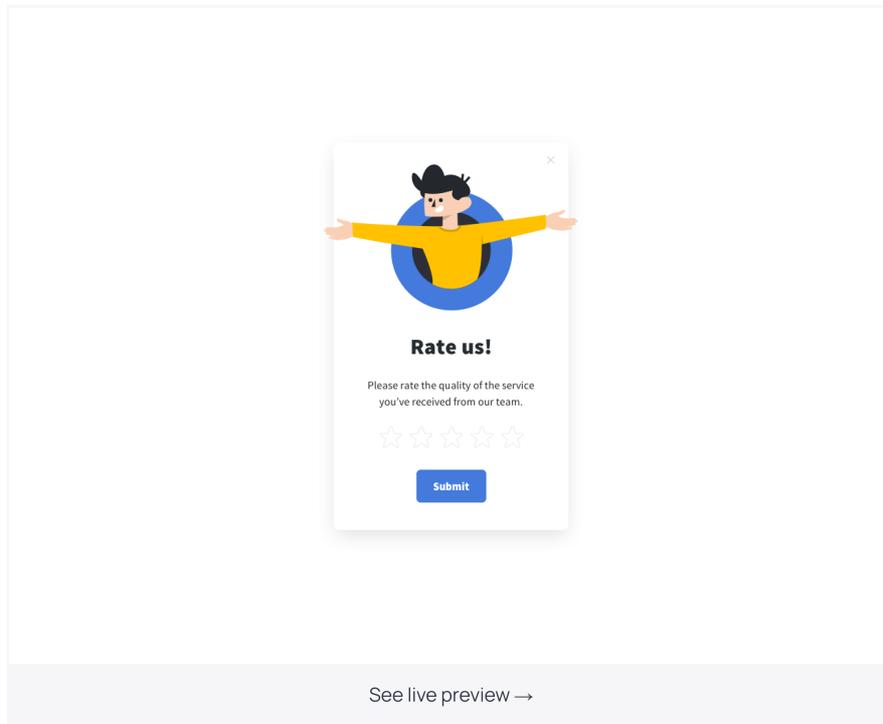

CES can be used to measure how much effort it takes for customers to use your product or fix a problem through customer support. As a rule, it includes the question “How easy it was to...?” and answer options on a scale from difficult (= high effort) to easy (= low effort)

Net Promoter Score® (NPS)

NPS appears to be one of the best customer satisfaction survey practices — or, at least, or of the most popular ones. Its main purpose is to gauge the loyalty between your business and customers based on responses to a question “How likely is it that you would recommend our service / product / company to a friend or colleague?” The scoring for this answer is most often based on a 0 to 10 scale.

Customer Satisfaction Score (CSAT)

CSAT measures satisfaction in the most direct way: by asking customers “How satisfied are you with...?”. Answer choices are graded on a scale, usually from 1-5, where 1 represents completely unsatisfied and 5 represents completely satisfied.

Best customer satisfaction survey practices

When designing your own customer satisfaction survey, you can stick to just one template or choose to combine the tactics mentioned above in one questionnaire – it is totally up to you.

After all, you know your audience better than anyone and can assume what approach may turn out to be the most effective in your particular case.

Still, there are some common practices you can use to keep your survey on the right track

#1 Don't ask too many questions

To get quality results, you should make sure that you have a very well-crafted objective when designing your survey. As already mentioned, sometimes it is enough to ask just one right question to get the feedback you really want. This will help you keep your survey focused and eliminate the risk of annoying your customers by bombarding them with questions.

#2 Ask one question at a time

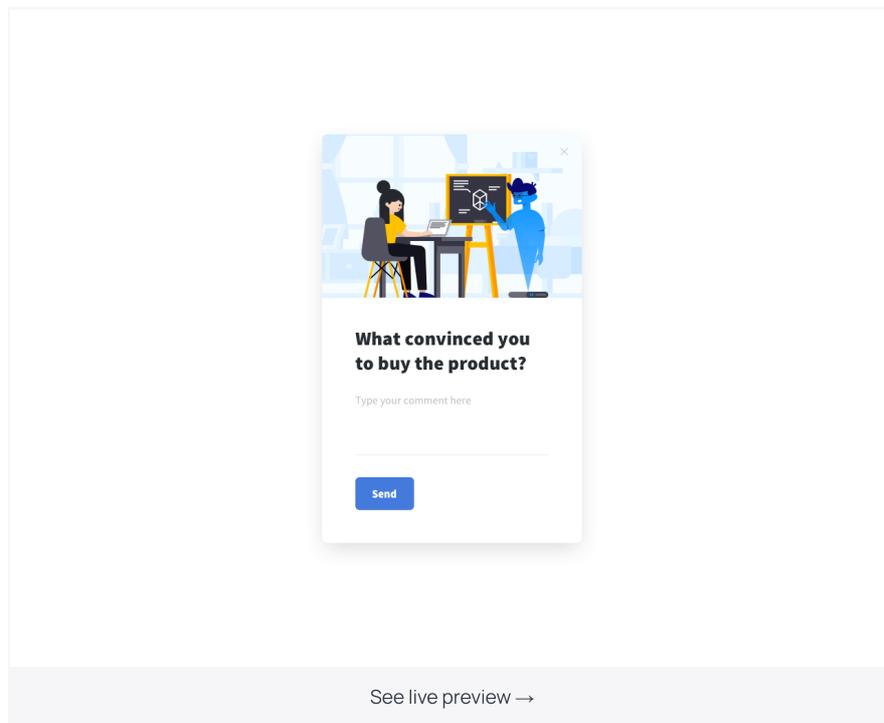

In the light of the previous recommendation, it may be very tempting to ask several things in one question: after all, this should help reduce the overall number of questions, which is good. Unfortunately, it doesn't work like that. When you ask two (or more) questions in one, it confuses customers and makes it difficult for them to answer. They'll be more likely to abandon your survey, and even if they answer, the results might not be accurate enough.

#3 Don't require a response to every single question

If you decide to pack your customer satisfaction survey with several questions, make sure not all of them are mandatory. It's better to let your respondents skip the question if they want to: there'll be less of a chance that your customers will leave the survey halfway because they don't want to answer a question and can't jump to the next one.

#4 Leave space for comments

Single-answer questions are certainly effective due to their preciseness, but they are not universal. Sometimes your customers may want to leave more detailed feedback — and it's important to give them such an opportunity. One of the best practices here is to put an open-ended question at the very end of your survey.

#5 Limit open-ended questions

Leaving space for comments is utterly important, but you also shouldn't go to the other extreme and overload your questionnaire with open-ended questions. Customers won't take time to complete your survey if it feels like a hard task, so it's better to lean on multiple choice or scale questions that can be answered fast and easy.

#6 Use branching logic to customize the survey path for each respondent

Sadly, not all customers will be satisfied with your service.

However, negative feedback may be even more valuable: it highlights the aspects of your product or service that need to be improved.

Don't miss the opportunity to go into detail: use branching logic to direct your unhappy customers to a separate path and ask them some specific questions about their negative experience.

How to create a customer satisfaction survey for your site

Now that you know the ins and outs of creating an effective customer satisfaction survey, let's see how you can add one to your website using Getsitecontrol form builder:

1. [Log in](#) to your Getsitecontrol dashboard.
2. Click [+Create widget](#) and choose [Conduct a survey](#) from the dropdown menu.
3. Select a webpage position, pick a suitable survey template and click [Choose & customize](#)
4. On the [Content](#) tab you can check the questions and the answer options, add or remove form fields.
5. If you'd like to change the look of the template, you can do it on the [Appearance](#) tab: change the colors for the widget and, if necessary, its size and paddings.
6. Click [Save & close](#) to save the widget and activate it.

Once you start receiving responses, you can download them using the [Download data](#)

button on the widget.

Based on your goals, you can choose to include single-answer multiple choice questions, open-ended questions, and a few other field types:

- multiple-answer questions
- dropdown lists
- checkboxes
- star rating scales
- email capture fields

Getsitecontrol survey forms are highly customizable, so you can always create a unique questionnaire that meets your goals perfectly. Using advanced targeting options and various triggers you can also ensure the survey will be displayed to select audience at the right moment.

You're reading Getsitecontrol usecase collection where we talk about the best practices for using website popups. This usecase is a part of [Receive feedback](#) section.
